

NEW

RF adapter ring for DENZ FDC multi

**Best devices for best results.
For selective users.
Made only by DENZ.**

Checking the flange focal distance with the DENZ FDC Multi provides an exact indication of the amount and direction (+ and -) of the deviation between the actual flange focal distance and the ideal flange focal distance. This allows you to determine the combination of necessary adjustment foils (shims) to correct the flange focal distance. The formerly slow and tedious approach to the flange focal distance is no longer necessary. As one of the most popular DENZ products worldwide the FDC-multi is a must have for everybody, who prefers working with exactly adjusted cameras. International leading camera manufactures are using this measurement tool to calibrate their cameras before delivery.

**NEW and available:
RF adapter Ring (#302.0220) for the FDC multi:**

The Canon RF mount is the current lens connector for Canon 35mm compact cameras of the R series.

The RF bayonet is a further development of the EF bayonet and has a shorter focal flange depth of 22mm.
